

# New THz Spectroscopic Tools for Laboratory Astrochemistry

Susanna L. Widicus Weaver  
Department of Chemistry  
Emory University

# Motivation: Understanding COMs in the ISM

## Grain surface formation

- Simple molecules form in ice via single-atom addition reactions
- Organic radicals form in ice via photolysis of simple molecules
- Radicals react during warm-up to form larger organics

$\text{H}_2\text{O}$ ,  $\text{CO}$ ,  $\text{CH}_3\text{OH}$ ,  
 $\text{NH}_3$ ,  $\text{H}_2\text{CO}$   
Ice mantle

## Gas phase formation

- Molecules are released from ices
- Gas-phase molecules are ionized
- Ion-molecule reactions drive gas-phase organic chemistry

*Transient molecules are the driving forces for both grain-surface and gas-phase chemistry.*

# Detected Interstellar Molecules

~40% are Radicals and Ions

# Production Methods

Discharges

Photolysis

- Small quantities (low efficiency)
- High temperatures = weak signals
- Interference from stable molecules
- Reactivity/instability of products

Matrix  
Isolation

Supersonic Expansions

# High-Sensitivity Cavity-Enhanced Spectroscopy

## Fabry-Perot cavity pulsed Fourier transform microwave spectrometer with a pulsed nozzle particle source

T. J. Balle and W. H. Flygare

*Noyes Chemical Laboratory, University of Illinois, Urbana, Illinois 61801*

(Received 28 July 1980; accepted for publication 12 September 1980)

$\sim 2 - 50 \text{ GHz}$

$> 1000 \text{ cm}^{-1}$

## Cavity ring-down optical spectrometer for absorption measurements using pulsed laser sources

Anthony O'Keefe and David A.G. Deacon  
*Deacon Research, 900 Welch Rd., Palo Alto, CA 94304*

*Review of Scientific Instruments*, **59**, 2544 (1988)

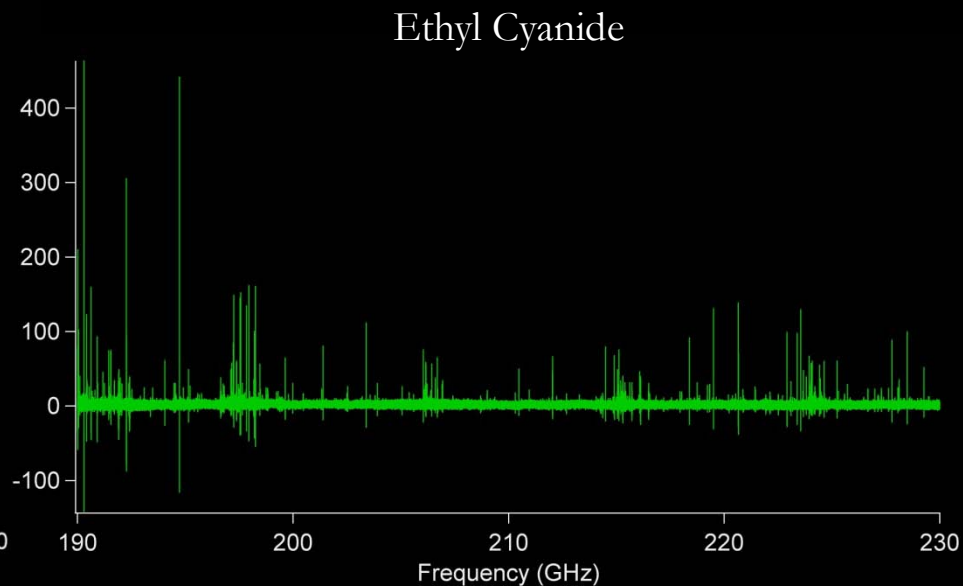

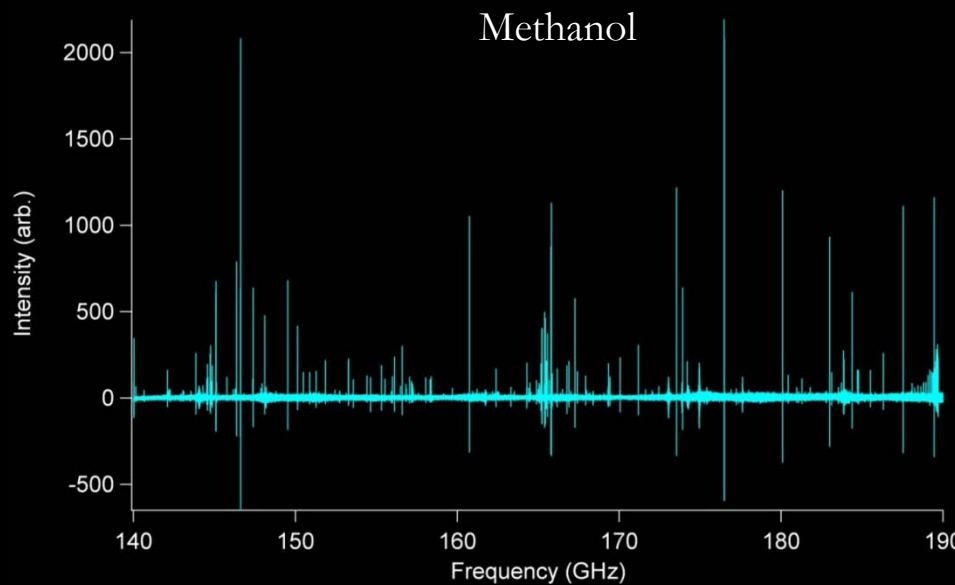

# The 'THz Gap'

ALMA Spectral Coverage

# Laboratory Spectral Cataloging

First light April 1, 2009!

# CRDS High Finesse Cavity

$$R = 99.99\%$$

cavity ringdown  
recorded

IR mirrors  $\rightarrow$  dielectric coated  
Losses due to transmission

THz mirrors  $\rightarrow$  metal coated  
Losses due to skin depth

# FTMW High Finesse Cavity

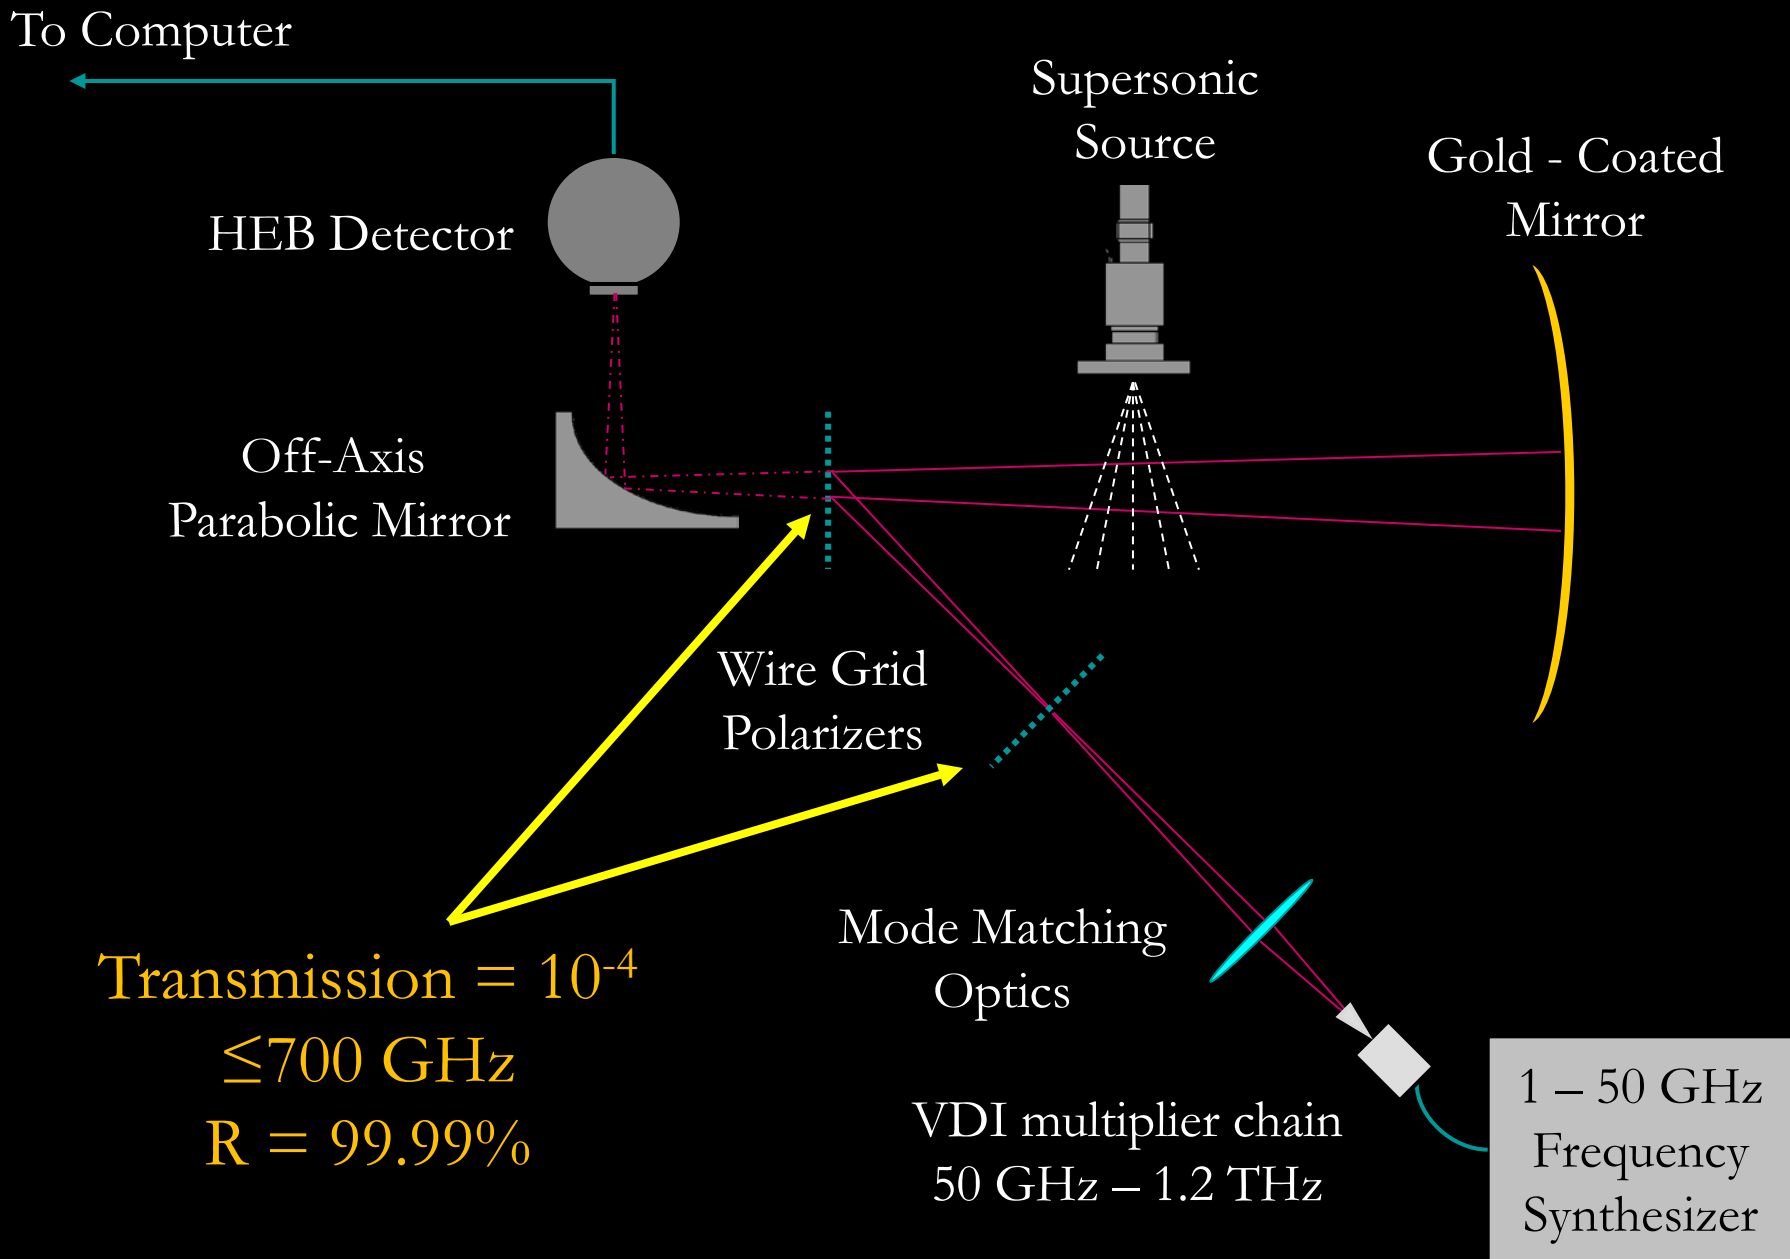

free-induction  
decay recorded

microwave mirrors  $\rightarrow$  aperture  
Large  $\lambda$ , small losses

THz mirrors  $\rightarrow$  ?  
Small  $\lambda$ , large losses with any aperture!

# Proposed THz-CRDS Spectrometer

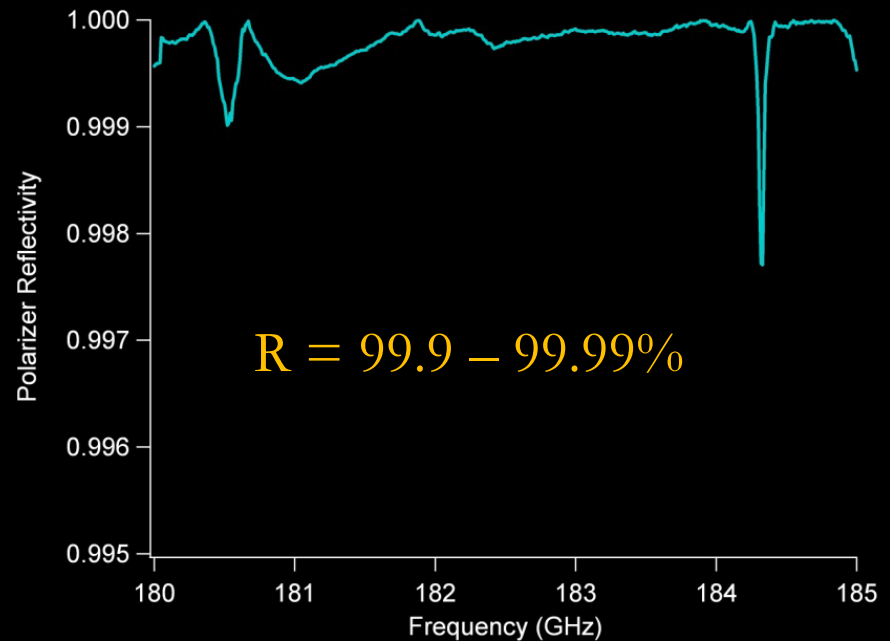

# Progress Toward THz-CRDS

Beam profiling completed,  
mode-matching calculations performed

Polarizer reflectivity  
tested up to 300 GHz

# Progress Toward THz-CRDS

Benchtop optics setup completed

Next Steps:

- Finish bench-top cavity tests: requires QMC HEB detector (expected to ship next week)
- Place cavity in vacuum chamber
- Test fully-integrated system
- Begin molecular spectroscopy
- Extend system to higher frequencies
- Extend concept to broadband spectral acquisition

# Future Work: FT-THz Spectroscopy

Similar cavity setup to THz-CRDS

Sample is polarized with high-power radiation pulse, FID recorded

Lower mirror R required: Optics are less demanding, modes are broader than CRDS

Hardware requirements are beyond current (commercially) available technology:

- Nb HEB heterodyne detector (can be custom-built by Prober group)
- Higher power amplifiers at higher frequencies (none commercially available; spare Herschel amps??)

In collaboration with Geoff Blake at Caltech and Dan Prober at Yale

# Future Work: TD-THz-CRDS

- Broadband THz radiation is generated via optical rectification of laser output
- THz radiation is coupled into cavity; cavity output signal is upconverted to visible light
- Ringdown signal is monitored directly
- Second beam is coupled into interferometer; time-dependence of ringdown is monitored
- Broadband frequency spectrum is deconvolved

In collaboration with Tim Lian  
and Brian Dyer at Emory

# Using THz Spectroscopy to Trace Prebiotic Chemistry in Space

What do we plan to measure?

- Photolysis branching ratios for complex organics
- Spectra of small, reactive organics produced via  $O(^1D)$  insertion
- Spectra of molecular ions with complex internal motion
- THz spectral catalogs of “interstellar weeds”
